

## **JOHN HARSHITH ALGORITHMS ASSIGNMENT PART-I**

### **JOHN HARSHITH MASTER THEOREM SOLUTION**

Find the time complexity of the below functions in  $\Theta$  form.  
Write NA if the function does not apply to any case.

**a)  $T(n) = 3T(n/2) + n$**

here  $a = 3$ ,  $b = 2$ ,  $d = 1$

$$\Rightarrow b^d = 2^1 = 2$$

$$\Rightarrow \text{hence, } a > (b^d)$$

$$\Rightarrow \Theta(n^{\log_a[\text{base } b]})$$

$$\Rightarrow \Theta(n^{\log_3[\text{base } 2]})$$

**b)  $T(n) = 64T(n/8) - n^2(\log n)$**

here  $a = 64$ ,  $b = 8$

but here  $f(n)$  which is the combination time is not positive  
hence, the above equation cannot be solved using the master theorem

$\Rightarrow$  **NA**

**c)  $T(n) = 2nT(n/2) + n^n$**

here  $b = 2$

but here  $a$  is not a constant which means the number of subproblems is not fixed

hence, the above equation cannot be solved using the master theorem

$\Rightarrow$  **NA**

**d)  $T(n) = 3T(n/3) + n/2$**

here  $a = 3$ ,  $b = 3$ ,  $d = 1$

$$\Rightarrow b^d = 3^1 = 3$$

$$\Rightarrow \text{hence, } a = (b^d)$$

$$\Rightarrow \Theta(n^d \log n)$$

$$\Rightarrow \Theta(n \log n)$$

**e)  $T(n) = 7T(n/3) + n^2$**

here  $a = 7$ ,  $b = 3$ ,  $d = 2$

$$\Rightarrow b^d = 3^2 = 6$$

$$\Rightarrow \text{hence, } a > (b^d)$$

$$\Rightarrow \Theta(n^{\log_a[\text{base } b]})$$

$$\Rightarrow \mathbf{\Theta(n^{\log_7[\text{base } 3]})}$$
